

# **Module 6: CHAR Function**

#### 6.1 Char Formula

The CHAR function (CHAR is for character), returns the character specified by a number.

It automatically translates code page numbers into characters. CHAR can be used to specify characters that are hard to enter in a formula.

The CHAR function is as follows: =CHAR (number).

The number refers to the character set used by your computer, and is up to number 255. For example, =CHAR(65) results in A on almost all computers.

Perhaps one of the most useful CHAR functions is CHAR(10) in Windows and CHAR(13) on a MAC, which return a line break.
