Module 19 : N Function

19.1 N Function

The N function allows you to obtain a value converted to a number.

This is relevant for numbers, a date, true or false, or an error value. Anything else will return 0. The formula for the N function is as follows:=N(value)

The value refers to the value you want converted.

If a value is or refers to a number, N will return that number.

If a value is a date in one of the acceptable Excel formats, N will return the serial number of that date.

If a value is TRUE, N will return 1.

If a value is FALSE, N will return 0.

If a value refers to an error value, like #DIV/0!, N will return the error value.
