

# Module 47: OR Function

## 47.1 OR Function

**The OR function in Excel will allow you to check whether any of the conditions you have set in an argument are true.**

If all the conditions are met, TRUE will be returned, and if not it will return a FALSE. You can use OR to check up to 255 conditions.

The formula is written as: **=OR(cell="logical1", cell="logical2")**

*logical1: The first condition to evaluate. logical2: The second (optional) condition to evaluate.*

The OR function is typically used in conjunction with an IF function. You can use it to return a specific result, rather than just a TRUE or FALSE.

The formula is written as: **=IF(OR(cell="logical1", cell="logical2")"value1", "value2")**

*value1 = The value to return if a logical condition is returned as TRUE. value2 = The value to return if a logical condition is returned as FALSE.*
