

## **Module 49: REPLACE Function**

## **49.1 REPLACE Function**

The REPLACE function in Excel is used to replace text based on its position within a string.

The formula is written as: =REPLACE(old text, start num, num chars, new text)

old text - The text to replace.

start\_num - The starting location in the text to search.

num chars - The number of characters to replace.

new text - The text to replace old text with.

You can use text within the formula to make the changes you would like to with REPLACE, or you can use cell addresses if you prefer. For example if you have the word "Fomola" and you would like to change it to "Formula" you can use either of the two formula below.

Examples of formulas: =REPLACE(old\_text, 3, 3, rmu) or if the information you need is in Cells A1, B1 and C1 you can use: =REPLACE(old\_text, A1, B1, C1)

Remember that all special characters, such as full stops, spaces and exclamation marks are counted as one character.
